Paradise Irrigation District

We're pushing project timelines to save money—and not disturb “new” paving

There's a lot of roadwork and construction going around our community these days—and we understand it's truly frustrating sometimes to be part of a community that is rebuilding itself after a disaster.

At Paradise Irrigation District we're aware of that frustration (we live here, too!) and continue to actively work in cooperation with the Town of Paradise so that our water infrastructure replacement projects, when possible, are done before the Town repaves roads.

Not only does that mean fresh pavement isn't being disturbed, but it also means PID is saving money in the process.

“The Town of Paradise has a three-year moratorium on work on newly-repaved roads,” explains PID Engineer Blaine Allen. That means for up to three years after the town approves a paving project, there's a moratorium on any work done—unless we replace what usually ends up being an entire section of road.

the trench. Since this includes lateral water lines, we'd typically need to repave both sides of the road,” says Allen. “This increases project costs dramatically.”

By working closely with the town and adjusting PID's own project timelines, the district can better manage costs, he explains.

“We've looked at our projects and have stepped up our timelines to do this on roads in our community such as Yorktown, Bella Vista, Elliott, Del Monte, Forest, Crandall, Deodora and Camellia,” Allen points out.

“For example, if we're trenching down the road, we'd have to replace the entire travel lane for the length of

“By working together with the town, we can minimize traffic disruption for our community and save the district money.”

”

I'm so glad we got the alert from the Dropcountr app. We had no idea we had a big water leak in our system! We were able to stop the leak before it did a lot of damage!

What's it like inside those big PID water tanks?

You've probably seen a few of PID's older water tanks, situated throughout the Ridge. This year those tanks are targeted for renovation and any needed repairs.

If you've ever wondered what the inside of the tanks look like, this collection of project photos provides your chance to find out!

Top left: Workers first cut into tank to create a door large enough to drive a forklift through.

Bottom left: Top vent corrosion will be repaired.

Bottom right: Ceiling is blasted then prime coated.
